

Totally Blues

BLUES OVERDRIVE PEDAL

Congratulations on your purchase of the Totally Blues pedal. The Totally Blues has some unique features that provide versatility over other overdrive devices. First, the Totally Blues has more gain for extra sensitivity. Second, the distortion circuit is configured for asymmetrical clipping for second harmonic enhancement. And third, the Mojo control adds depth and fullness of the guitar signal as it is feed into the distortion circuit. This will also change the distortion characteristics as the control is increased.

GAIN – Sets the amount of distortion desired.

OUTPUT- Adjusts the overall level.

TONE- Adjusts the amount of treble after the distortion circuit.

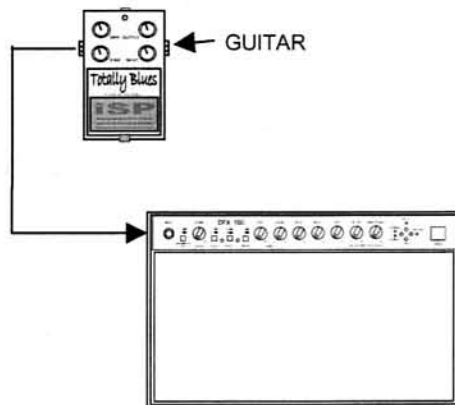

MOJO- Adjusts the amount of low end frequency being feed into the distortion circuit.

BATTERY/ADAPTER

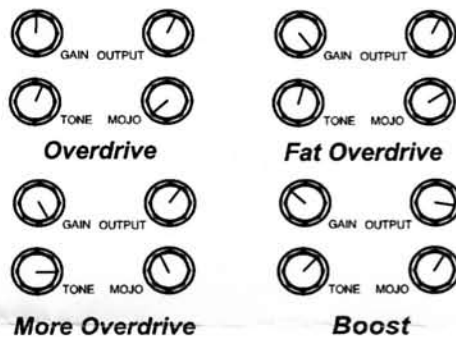

To install the battery, loosen the thumbscrew shown above and raise the switch cover to allow access to the battery compartment. Insert a 9v battery to the connector and place the battery into its compartment and close by holding the switch cover down and tightening the thumbscrew.

To use the Totally Blues with an external power adapter, select an adapter with at least 100 milliamps capability at 9 volts DC. Make sure the adapter is polarized "TIP NEGATIVE".
